---

An algorithm for rapidly computing the complex Voigt function was published by Shippony and Read [1]. Its claimed accuracy was 1 part in  $10^8$ . It was brought to our attention by Wells [2] that Shippony and Read [1] was not meeting its claimed accuracy for extremely small but non zero  $y$  values. Although true, the fix to the code is so trivial to warrant this note for those who use this algorithm. In the code, there exist in two subroutines, `VoigtR1` and `VoigtR3` a threshold variable called `tiny = 1.0d-12`. Any value of  $10^{-12} > y > 0$  may have errors exceeding the target accuracy. The parameterization for `tiny` should have been the minimum precision of the computer (it is machine dependent, for the SGI origin it is `tiny = 2.2d-16`). Fortunately, FORTRAN 90 has a function, `epsilon(y)` that returns the smallest allowable value therefore setting `tiny = epsilon(y)` will ensure the algorithm's accuracy on any

platform. We thank R. J. Wells for bringing this error to our attention.
